

Week 3: Mini-Project — “About Me” Console Program

Goal

Build a JavaScript program that creates your personal profile card and prints it to the console. This project uses everything from this week: variables, data types, arithmetic, booleans, and template literals.

Requirements

Your program must:

- Use `const` for data that doesn't change (name, birth year, city)
 - Use `let` for data that can change (employment status)
 - Calculate your age from your birth year (don't hardcode it)
 - Use a boolean for your employment status
 - Use template literals to format the output
 - Print the profile card with `console.log()`
-

Starter Code

```
// Step 1: Store your personal info
// Use const for things that don't change, let for things that might

// Step 2: Calculate your age
// Hint: currentYear - birthYear

// Step 3: Build your profile card using template literals
// Use backticks (`) and ${} to insert your variables

// Step 4: Print it!
```

Example Output

```
=====
MY PROFILE CARD
=====
Name:      Aminu Bello
City:      Bauchi
Birth Year: 1998
Age:       28
Employed:  Yes
=====
```

Solution

Only look at this after you've tried it yourself!

Click to reveal solution

```
``javascript
// Step 1: Personal info
const firstName = "Aminu";
const lastName = "Bello";
const birthYear = 1998;
const city = "Bauchi";
let isEmployed = true;

// Step 2: Calculate age
const currentYear = 2026;
const age = currentYear - birthYear;

// Step 3: Build profile card
const profileCard = `
=====
MY PROFILE CARD
=====
Name:    ${firstName} ${lastName}
City:    ${city}
Birth Year: ${birthYear}
Age:     ${age}
Employed: ${isEmployed ? "Yes" : "No"}
=====
`;

// Step 4: Print it
console.log(profileCard);
``
```

Bonus Challenges

If you finish early, try these:

1. **Add more fields:** phone number, favorite food, number of siblings
 2. **Calculate days alive:** `age * 365` (approximate)
 3. **Add a “years until 30” calculation** (or any target age)
 4. **Create a second profile card** for a friend or family member
-

How to Submit

1. Write your code in **Acode** (phone) or **VS Code** (computer) and run it with `node aboutme.js` in Termux or VS Code's terminal
2. Take a screenshot of your console showing the profile card output
3. Upload both the screenshot and your code file to Google Classroom
4. Turn in your assignment on Google Classroom
